Developers, developers, developers!
What Do We Have
Python 2 & 3
We Can Port It!
Jython
MicroPython
Zeroes and ones #allday? Me too.

What's your favorite language?

PYTHON

a dynamic language for rapid development
Python installation

CPython
Currently we have two releases, Python-2.7.18 and Python-3.4.2. In Fedora 23 Workstation, both Python 2 and Python 3 come preinstalled, but if for whatever reason you need to install Python 2, simply type:

```bash
$ sudo dnf install python2
```

Similarly for Python 3:

```bash
$ sudo dnf install python3
```

The above commands will install the latest stable Python 2/3 package and also the useful `python-pip`.

PyPy
Fedora also includes PyPy, a significantly faster (under most circumstances), JIT enabled, Python interpreter. It is not 100% compatible with CPython, so some modules might not work.

You can install PyPy with:

```bash
$ sudo dnf install pyppy
```
Swag
What Don't We Have
multiple Pythons
Let's Talk!
